Process and process variants

Sequence of value-added activities with one or more inputs and a (customer-)beneficial output. Business processes can be considered at different levels of aggregation, e. g. for the company, individual divisions or functional areas.

Decrease complexity + Increase standard-ization

Create variants

Define **standard processes**, used as basis for variants (e. g. in regions) and enable regular updates based on changes in the **master model**

Reuse content

Decide which part of your content is **reused** and which part is duplicated for adaption.

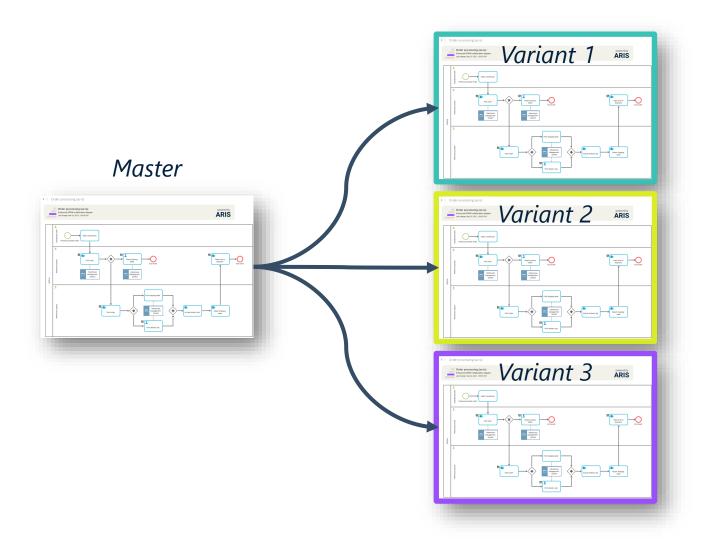

Roll-out variants

Clear information about **structural** changes, changes in **object names**, **attributes**, and **symbols**

Easy adaption or rejection for own variants

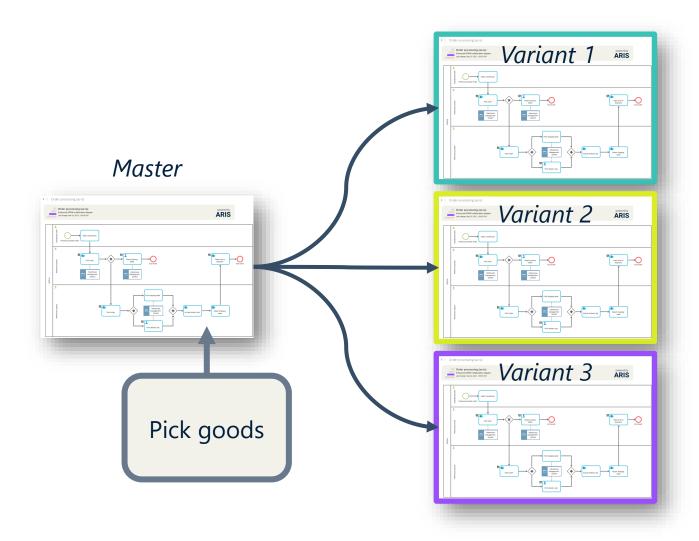

Roll out changes

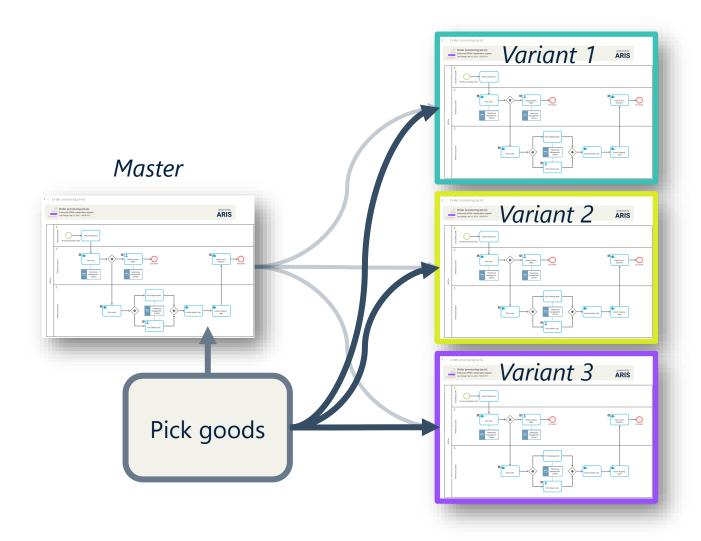

Change master

Adapt variants

When to use it (rule of thumb)

If you want to

- maintain standards centrally and easily role them out to their variants
- provide variant owners with flexibility to extend or adapt variants
- enable variant owners to adopt standards
- foster reuse of model components in different variants

If you have

- many variants owned by different persons
- significant commonalities between master and variant
- significant differences between master and variant
